## Introduction

---

This module allows you to add a custom information section to your products. This information will appear in a new tab on the product detail page in your store.

## Installation

---

1. Upload the module folder `topbarbacoa_addinfo` to your `/modules` directory.
2. Go to **Modules > Module Manager** in your PrestaShop admin panel.
3. Search for "Topbarbacoa Información Extra".
4. Click **Install**.

## How to use

---

1. Go to **Catalog > Products**.
2. Edit an existing product or create a new one.
3. In the product edition form, look for the section/tab named **"Información extra en producto"**.
4. You will see an HTML editor (TinyMCE) where you can add text, images, or custom HTML.
5. Save the product.
6. Check your product page on the store front. A new tab "Información extra" will be visible with your content.

## Multilingual Support

---

If your store uses multiple languages, you can specify different content for each language using the language selector next to the field.

## Tips

---

- Use the HTML editor to create visually appealing information sections.
- You can include links, basic tables, and formatted text.

# Technical Documentation - Topbarbacoa Extra Information

## Module Overview

- **Name:** `topbarbacoa_addinfo`
- **Compatibility:** PrestaShop 1.7.8.0, 8.x, 9.x
- **Main Class:** `Topbarbacoa_Addinfo`
- **ObjectModel:** `AddInfoContent`

## Architecture

The module uses the Symfony-based form builder in the PrestaShop back office to inject a new field group in the product edition page.

## Database Schema

**Table:** `ps_topbarbacoa_addinfo`

| Column                  | Type    | Description             |
|-------------------------|---------|-------------------------|
| <code>id_product</code> | INT(11) | Primary Key, Product ID |
| <code>id_shop</code>    | INT(11) | Primary Key, Shop ID    |

**Table:** `ps_topbarbacoa_addinfo_lang`

| Column                     | Type    | Description                     |
|----------------------------|---------|---------------------------------|
| <code>id_product</code>    | INT(11) | Primary Key, Product ID         |
| <code>id_shop</code>       | INT(11) | Primary Key, Shop ID            |
| <code>id_lang</code>       | INT(11) | Primary Key, Language ID        |
| <code>extra_content</code> | TEXT    | HTML content for the extra info |

## Hooks

1. `actionProductFormBuilderModifier` : Modifies the product form builder to add a new form group containing the extra content field.
2. `actionAfterUpdateProductFormHandler` : Handles the saving process when the product form is submitted.
3. `displayProductExtraContent` : Displays the saved extra content in a new tab on the product front page.

## Implementation Details

---

- **Form Builder:** Uses `FormType` as a container and `TranslateType` with `FormattedTextareaType` for the HTML multi-lingual field.
- **Locales Handling:** In PrestaShop 8+, Symfony forms use locales (e.g., `es-ES`) instead of language IDs for field mapping. The module handles the conversion between locales and `id_lang` for database persistence.
- **Data Persistence:** Uses a custom `ObjectModel` ( `AddInfoContent` ) with multi-shop and multi-lang support.
- **Sanitization:** Uses `pSQL` and PrestaShop's standard `ObjectModel` validation.

# Developer Guide - Topbarbarcoa Extra Information

## Development Standards

- **Coding Style:** PSR-12 compatible (PSR-2 minimum).
- **Translations:** Uses the PrestaShop Modern Translation System ( `isUsingNewTranslationSystem() => true` ).
- **Security:** All files start with `if (!defined('_PS_VERSION_')) exit; .`

## Extending the Form

To add more fields to the "Información extra" tab, modify the `hookActionProductFormBuilderModifier` method:

```
$tiposTab->add('new_field', TranslateType::class, [  
    'type' => FormattedTextareaType::class,  
    'label' => $this->trans('New Field', [], 'Modules.Topbarbarcoaaddinfo.Admin'),  
    // ...  
]);
```

Ensure the corresponding field is added to the `AddInfoContent` model and the database table.

## Manual Class Loading

Since the module avoids `composer` , all custom classes must be manually required in the main module file:

```
require_once _PS_MODULE_DIR_ . 'topbarbarcoa_addinfo/classes/AddInfoContent.php';
```

## Troubleshooting

- **Field not showing:** Ensure the module is hooked to `actionProductFormBuilderModifier` .
- **Content not saving:** Check `hookActionAfterUpdateProductFormHandler` and ensure the field name matches the form data structure.
- **Frontend tab hidden:** The tab only appears if there is content saved for the current product and language.
